# Company profile

- Company name: Aam Aadmi Party
- Aam Aadmi Party (AAP), is an Indian political party, formally launched on 26 November 2012, and is currently the ruling party of the National Capital Territory of Delhi.
- It deals in various profiles like HR, Public Speaking, Data Analytics and Machine Learning.

#### **Problem Statement:**

- It has been seen that in 2013 Vidhan sabha election that aap and congress was almost toe to toe but suddenly in 2015 vidhan sabha election they won by a large margin and the margin was achieved by the votes acquired previously by congress.
- So we wanted to analyze the voters who are most likely to swing and which age category so we did this analysis and also we wanted to find the migrants as well as analyze different families to get better idea what kind of policy they might like.
- We find the swingable voters by category using a simple frequentist approach
- What we did was first, find the frequencies in different categories of age group through the data we extracted from electoral roll.
- Then, we also find the frequencies of different political parties through the data we extracted from form 20 of the same locality and merge the two to find the swingable voters by age group in different political parties.

# Objectives:

- Find out how many male and female voters are there in the given electoral roll for the polling stations. Also segregate male and female voters separately in intervals of five years.
- Obtain form 20 data for five polling stations for the last assembly or parliament election. Find out the probabilities
  of different age groups voting for BJP.
- Segregate voters family wise and find out the name of the head of the family, house number and number of members in that family
- Which are the voters who are likely to be migrants.
- Try to study the epic id which is voter id, system. What information can you gather out of it? Given the structure of the EPIC ID, is it possible to find out when a specific person has become a voter in this locality or when was a person's name included in the electoral roll for this polling station. A range of years would also be okay.

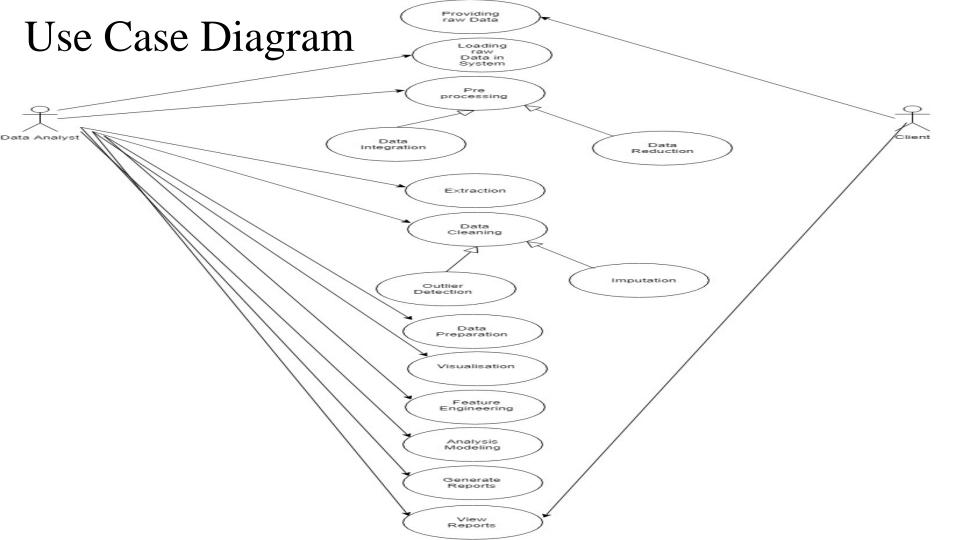

# Technology used:

- Python 3.7 with various libraries
- Libraries:
  - Numpy
  - Matplotlib and Seaborn
  - sklearn
  - Pdf2Image, Optical Character Recognition (OCR), Python Imaging Library (PIL), OpenCV and Tesseract
- Jupyter notebook
- Anaconda 2018.12
- Excel 2019

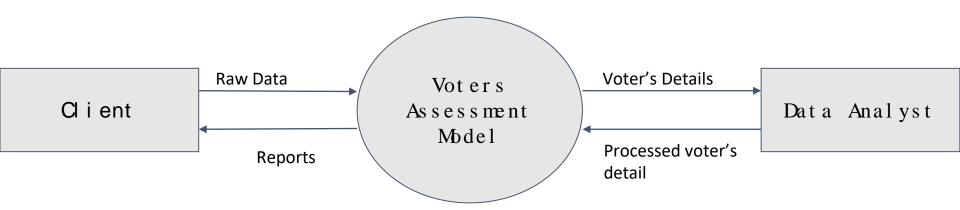

#### Collection of data:

• We extracted electoral roll using image processing. Source of this data is election commission's website.

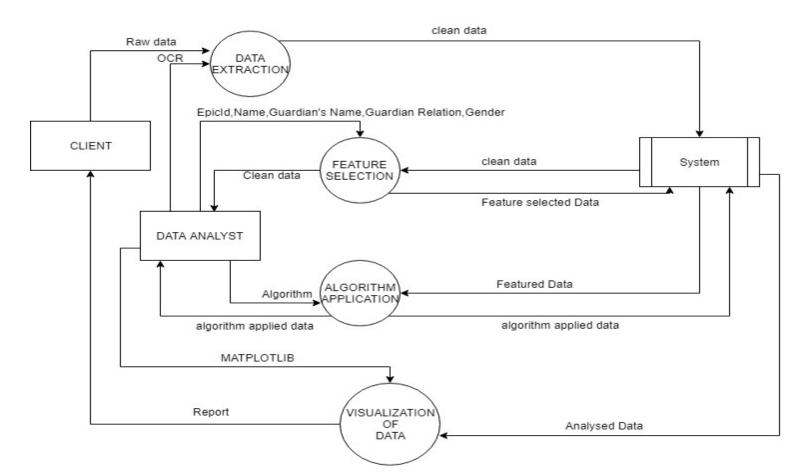

- Collection of features was done through web scraping.
- Optical character recognition techniques were used in image processing and geolocation API was used in web scraping.

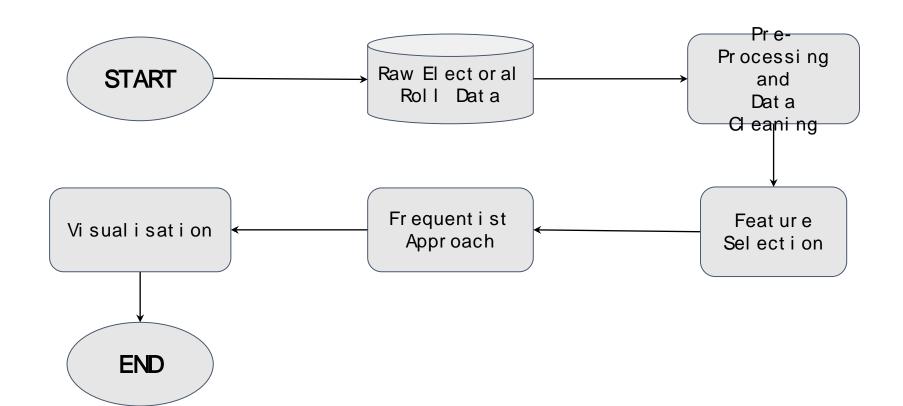

### DFD: Level 0

### DFD LEVEL 1

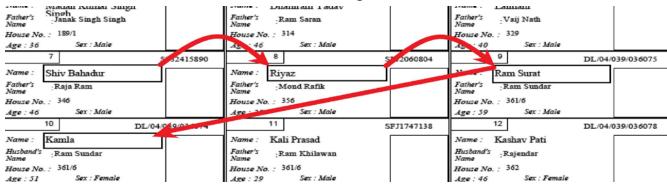

# Workflow Diagram

#### Extraction of Data

- We crop part of image rectangularly and extract text of image.
- Additionally we have to extract same data 30 times. We know they have equal distance. So
  will hop one by one till we reach end of the page. We will do that for every feature we are
  extracting. Notice that in below image that we extend the size of box to max on right, that is
  because we are not sure what will be the length of name.

# Combining Multiple files

 Used combine code to combine 500 files after extracting. We can combine tesseract 3 and 4 files easily using filenames

name	guardian	gen	g_relation	age
Pooja	Lalit Ram	F	F	20
Shanti Devi	Munna Lal	F	Н	36
Rajesh Paswan	Sohan Paswan	М	F	35
Rajesh Kumar Kori	Algu Ram Kori	М	F	30
Prashuram Kimnar	Ram Dev Parsad	М	F	25
Manish Kumar	Ayodhya Prashad	М	F	32
Mazhar Ansan	Abbas Ansari	F	F	55
Bhagwati Devi	Pale Ram	F	Н	70
Roshn Khatoon	Mustfa Ali	F	Н	28
Sanjay Kumar	Fekan Prasad	F	F	26
Indrawati Devi	Roop Singh	F	Н	51
Rupesh Sharma	Kanbaiya Lal Shamma	М	F	38
Arvind Kumar	Mangu	М	F	31
Sushila Devi	Rajeshmwar Ram	F	Н	55

#### PROCEDURE OF ANALYSIS

- We did use Frequentist approach:
- First, we found the age group wise population through electoral data we Extracted.
- Then, using form 20 data we find the likelihood of major parties.
- After that, we combine the age group wise likelihood and major parties likelihood to come up with likelihood of different age group voting for different parties.
- We also found out about the Religion of every person using their surnames.
- Finding about which person is likely to be a Migrant.

### Conclusion

- 2823 out of 6173 are migrants in part 4 of Karol Bagh.
- The most Swingable voters are in the age group 18-23, 23-28, 28-33.
- Many peoples living alone so they became head of their own family.

### Limitations

- The data transfer undergoes encryption methodology that is conventionally complex and costly.
- The requirement of high processing systems and upgraded browsers capable of handling trillions
  of records is another issue.

#### **FUTURE PROSPECTS**

- We can further extend this project by conducting *Frequentist Aprroach*, *Family analysis*(between two or more different constituencies, for eg: R.K. Puram and Rajinder Nagar).
- Currently we have only conducted *intra-cluster analysis* (within one constituency).
- We can predict features of other constituencies by determining the similarity of their regions based on the affluence of that region.
